

ABSTRACT OF THE DISCLOSURE

A method, system, and/or computer useable medium to facilitate name preservation across an unrestricted set of TLDs. TOP LEVEL DOMAIN TOPOLOGY (TLDT) software is executed in a TLDT system. A register is chosen to register a predetermined secondary level domain (SLD) name/inclusive name space for a particular TLD. Data is retrieved for a desired SLD name to register the SLD name in association with at least one TLD in at least one of a Public Root and an Internet Corporation for assigned Names and Numbers (ICANN) Root. A search is conducted of at least one of a Public Root and an ICANN Root and it is determined whether the desired SLD is associated with any TLDs that exist. The desired SLD is registered with all of those TLDs if the user agrees to pay the periodic fee.
